

Day 4

A module is a Python file containing code
import my_tools.py as mt my_tools.py

We can import one module to other file.

```
if __name__ == "__main__":  
    print("Hello world")
```

Run code inside the block only if it's running directly
do not run that part if imported to other file as module

```
import module  
from module import item  
as  
if __name__ == "__main__":
```
