

① Aug - 10

String is sequence of character

price = 12.5
print(f"price: {price:.2f}")
→ show 2 digit after decimal point
→ fixed point notation
→ display num. using decimal notation (not scientific)

→ `format()` → `print("Hello {}".format(name))`

→ `name.upper()` → prints string in capital
`name.lower()` → " " in small letter

`name.replace("Prakash", "Alex")`
`.replace(old, new)` replaces the string

↳ `name.strip()` → removes whitespace in both sides, not inside the sentence

`name.split()` → Splits the sentence in space and creates a list
↳ returns list

↳ `name.join()` →
↳ `" ".join(words)` → list to sentence
↳ what to be in middle

`find()` → search first text inside another string
↳ gives the index

— I means not found

`" " " " In` for multiline
